Department of Artificial Intelligence and Data Science

ASSESSMENT TOOL 2 – Technical Presentation

Course Code:	DSA0302	**Course Title:**	Natural Language Processing
CO Assessed:	CO1 – Imitation (L1)	**Assessment:**	Assessment Tool 2 – Technical Presentation
Weightage:	30% of CIA		
CO1 Statement:	Analyse NLP models, regular expression patterns, finite state automata, morphological processing techniques and to interpret language processing. (BL-3)		
Student Name:	B Avinash	**Reg. No.:**	192425373
Section / Batch:	Slot A	**Date:**	15/07/2026

Code of Conduct

I B.Avinash/192425373 certify that this submission is my original work and that I have adhered to the guidelines specified for this assessment. I understand that any violation of academic integrity rules will result in disciplinary action.

Signature of the Student: ___________________________

Instructions

- Suggested Team Member Roles (3 Members)
- Member 1: Theory, Concepts, and Literature Review
- Member 2: Algorithm Design, Models, and Technical Analysis
- Member 3: Demonstration, Case Study, Applications, and Conclusion
- GPS photo must submit.
- Duration: 30 minutes.

Section / Topic	Focus	Q Nos
Evolution of Natural Language Processing: From Rule-Based Systems to Modern NLP	NLP Models, Language Processing Evolution	TP-01
Comparative Study of NLP Models and Algorithms	Model Analysis, Algorithm Comparison	TP-02
Regular Expressions for Real-World Text Processing	Pattern Matching, Information Extraction	TP-03
Designing Efficient Regular Expression Patterns for Information Extraction	Text Mining, Data Extraction Techniques	TP-04
Finite State Automata in Natural Language Processing	State Transitions, Language Recognition	TP-05
Building a Finite State Automaton for Token Recognition	Lexical Analysis, Token Validation	TP-06
Morphology and Word Formation in Natural Languages	Morpheme Analysis, Word Structure Processing	TP-07
Inflectional Morphology: Understanding Grammatical Variations	Grammatical Analysis, Word Normalization	TP-08
Derivational Morphology and Vocabulary Expansion	Word Generation, Semantic Transformation	TP-09
Comparative Analysis of Inflectional and Derivational Morphology	Morphological Classification, Language Analysis	TP-10

Finite-State Morphological Parsing Techniques	Morphological Parsing, Finite-State Processing	TP-11
Morphological Analysis for Indian Languages	Language-Specific Morphology, NLP Challenges	TP-12
Porter Stemmer: Design, Working Mechanism, and Applications	Stemming Algorithms, Text Preprocessing	TP-13
Stemming vs Morphological Parsing: A Comparative Study	Word Reduction, Morphological Processing	TP-14
Integrated NLP Pipeline: From Regular Expressions to Morphological Processing	End-to-End Language Processing Pipeline	TP-15

Annexure A – Technical Presentation

Team No.	Technical Presentation Title	Description
1	Evolution of Natural Language Processing: From Rule-Based Systems to Modern NLP	Analyze the historical development of NLP models, key milestones, and how language processing has evolved from handcrafted rules to intelligent systems.
2	Comparative Study of NLP Models and Algorithms	Explore different NLP models and algorithms used for language processing, comparing their working principles, strengths, and limitations.
3	Regular Expressions for Real-World Text Processing	Demonstrate how regular expressions are used for data validation, text extraction, log analysis, and information retrieval in practical applications.
4	Designing Efficient Regular Expression Patterns for Information Extraction	Analyze complex regular expression patterns used to extract emails, phone numbers, URLs, dates, and structured information from unstructured text.
5	Finite State Automata in Natural Language Processing	Explain the concepts of deterministic and non-deterministic finite automata and their role in lexical analysis and language recognition.
6	Building a Finite State Automaton for Token Recognition	Design and demonstrate a finite state automaton that recognizes tokens such as identifiers, keywords, and numbers in textual data.
7	Morphology and Word Formation in Natural Languages	Investigate how words are structured and formed using morphemes, and analyze the importance of morphology in NLP systems.
8	Inflectional Morphology: Understanding Grammatical Variations	Examine how inflectional changes affect word forms based on tense, number, gender, and case across different languages.
9	Derivational Morphology and Vocabulary Expansion	Analyze derivational processes that create new words and study their impact on semantic interpretation and language understanding.
10	Comparative Analysis of Inflectional and Derivational Morphology	Compare the characteristics, applications, and challenges of inflectional and derivational morphology in NLP tasks.
11	Finite-State Morphological Parsing Techniques	Explore finite-state transducers and parsing techniques used to analyze and generate morphological structures in natural languages.
12	Morphological Analysis for Indian Languages	Study the challenges and solutions involved in performing morphological processing for morphologically rich Indian languages such as Tamil, Hindi, and Telugu.
13	Porter Stemmer: Design, Working Mechanism, and Applications	Analyze the Porter Stemming algorithm, its rule-based approach, implementation steps, and role in information retrieval systems.
14	Stemming vs Morphological Parsing: A Comparative Study	Compare stemming and morphological parsing techniques based on accuracy, computational complexity, and application scenarios.
15	Integrated NLP Pipeline: From Regular Expressions to Morphological Processing	Demonstrate a complete NLP preprocessing pipeline incorporating regular expressions, finite state automata, stemming, and morphological analysis for text processing.

Rubrics for Calculation

Technical Presentation					
Criteria	**Weightage**	**Level 4 – Exemplary**	**Level 3 – Proficient**	**Level 2 – Developing**	**Level 1 – Beginning**
Technical Content Accuracy	30	Highly accurate, in-depth, and insightful technical explanation	Technically correct content with adequate depth and clarity	Basic concepts presented with limited accuracy and depth	Content contains major technical errors; concepts poorly understood
Problem Identification	25	Problem rigorously analyzed using appropriate and advanced methods	Problem clearly defined with a logical engineering approach	Problem identified but analysis or methodology is weak	Problem statement unclear or incorrect; no logical approach
Use of Tools	20	Advanced tools, well-analyzed data, and highly effective visuals	Appropriate tools and data used effectively with clear visuals	Limited use of tools and basic data interpretation	Minimal or incorrect use of tools and data; poor visuals
Communication	15	Highly engaging, confident, and audience-focused delivery	Clear, organized, and professional communication	Understandable but lacks clarity, structure, or confidence	Poor organization, unclear speech, ineffective slides
Professionalism	10	Exemplary professionalism, leadership, and ethical awareness	Professional conduct with effective team collaboration	Basic professionalism; uneven team participation	Lacks professionalism; minimal contribution or ethical awareness

Team No. / Criteria Level	**Technical Content Accuracy**	**Problem Identification**	**Use of Tools**	**Communication**	**Professionalism**	**Total %**

DSA0302—NATURAL LANGUAGE PROCESSING

Porter Stemmer: Design, Working Mechanism, and Applications

B Avinash(192425373)

GUIDE:
Dr. T. DEVI
PROFESSOR.

INTRODUCTION

- **Porter Stemmer** is a popular **rule-based stemming algorithm** used in Natural Language Processing (NLP).
- It was developed by **Martin Porter** in **1980**.
- It removes **suffixes** (word endings) to find the **root (stem)** of a word.
- It helps reduce different forms of the same word into a single base form.
- Porter Stemmer is mainly used during **text preprocessing** before text analysis or machine learning.
- It improves the efficiency and accuracy of NLP applications by reducing the number of unique words.

Working Mechanism

- **Input:** The algorithm receives a word (e.g., **Playing**).
- **Check Suffix:** It checks whether the word ends with common suffixes like **-ing, -ed, -s, -es**.
- **Apply Rules:** The Porter Stemmer applies predefined rules to remove the suffix.
- **Generate Stem:** The remaining part of the word becomes the **stem (root form)**.
- **Repeat:** The same process is applied to every word in the text.
- **Example:**

  Playing → Play

  Connected → Connect

  Students → Student

Implementation

```python
# Simple Stemmer (No NLTK Required)

word = input("Enter a word: ")

if word.endswith("ing"):
    stem = word[:-3]
elif word.endswith("ed"):
    stem = word[:-2]
elif word.endswith("es"):
    stem = word[:-2]
elif word.endswith("s"):
    stem = word[:-1]
else:
    stem = word

print("Original Word :", word)
print("Stemmed Word  :", stem)
```

output

Output

```
Enter words: playing walked walked studies connected

Original    Stemmed
playing          play
walked       walk
walked       walk
studies          studi
connected        connect

=== Code Execution Successful ===
```

Advantages & Disadvantages

Advantages

- Simple and easy to implement.
- Fast processing speed.
- Reduces vocabulary size.
- Improves search accuracy.
- Saves storage space.
- Widely used in NLP applications.

Disadvantages

- May produce incorrect stems.
- Does not consider word meaning.
- Works mainly for English.
- Can over-stem or under-stem words.
- Less accurate than lemmatization.
- Some output words are not valid dictionary words.

CONCLUSION

- Porter Stemmer is a simple, fast, and rule-based stemming algorithm.
- It removes common suffixes to produce the stem of English words.
- It improves the efficiency of text preprocessing in NLP tasks.
- Widely used in search engines, information retrieval, text mining, and machine learning.
- Although effective, it may sometimes produce over-stemmed or under-stemmed words.
